LAB ASSIGNMENT-6.5

M. ABHISHEK

2303A51762

BATCH-11

Experiment 6: AI-Based Code Completion: Working with suggestions for classes, loops, conditionals.

Task Description #1 (AI-Based Code Completion for Conditional Eligibility Check-

Task: Use an AI tool to generate eligibility logic.

Prompt: “Generate Python code to check voting eligibility based on age and citizenship.”

```
ets > ASS6.5.PY > ...
1   #Generate Python code to check voting eligibility based on age and citizenship.
2
3   age = int(input("Enter your age: "))
4   citizenship = input("Are you a citizen of the country? (yes/no): ").lower()
5
6   if age >= 18 and citizenship == "yes":
7       print("You are eligible to vote.")
8   else:
9       print("You are not eligible to vote.")
```

Output:

```
PS C:\Users\harik\My project> & C:/Users/harik/AppData/Local/Programs/Python/Python313/python.exe "c:/Users/harik/My project/Assets/ASS6.5.PY"
Enter your age: 18
Are you a citizen of the country? (yes/no): yes
You are eligible to vote.
PS C:\Users\harik\My project>
```

Code generated by AI:

```
age = int(input("Enter your age: "))
citizenship = input("Are you a citizen of the country? (yes/no): ").lower()
if age >= 18 and citizenship == "yes":
    print("You are eligible to vote.")
else:
```

print("You are not eligible to vote.")

Task Description #2(AI-Based Code Completion for Loop-Based String Processing)

Task: Use an AI tool to process strings using loops.

Prompt: “Generate Python code to count vowels and consonants in a string using a loop.”

```
#Generate Python code to count vowels and consonants in a string using a loop
def count_vowels_consonants(input_string):
    vowels = "aeiouAEIOU"
    vowel_count = 0
    consonant_count = 0

    for char in input_string:
        if char.isalpha():  # Check if the character is a letter
            if char in vowels:
                vowel_count += 1
            else:
                consonant_count += 1

    return vowel_count, consonant_count
```

```
# Example usage
input_string = "Hello World"
vowels, consonants = count_vowels_consonants(input_string)
print(f"Vowels: {vowels}, Consonants: {consonants}")
```

Output:

```
PS C:\Users\harik\My project> & C:/Users/harik/AppData/Local/Programs/Python/Python313/python.exe "c:/Users/harik/My project/Assets/ASS6.5.PY"
PS C:\Users\harik\My project> & C:/Users/harik/AppData/Local/Programs/Python/Python313/python.exe "c:/Users/harik/My project/Assets/ASS6.5.PY"
Vowels: 3, Consonants: 7
PS C:\Users\harik\My project> & C:/Users/harik/AppData/Local/Programs/Python/Python313/python.exe "c:/Users/harik/My project/Assets/ASS6.5.PY"
Vowels: 3, Consonants: 7
```

Code generated by AI:

def count_vowels_consonants(input_string):

vowels = "aeiouAEIOU"

    vowel_count = 0

    consonant_count = 0

for char in input_string:

        if char.isalpha(): # Check if the character is a letter

```
        if char in vowels:
            vowel_count += 1
        else:
        consonant_count += 1
 return vowel_count, consonant_count
# Example usage
input_string = "Hello World"
vowels, consonants = count_vowels_consonants(input_string)
print(f"Vowels: {vowels}, Consonants: {consonants}")
```

Task Description #3 (AI-Assisted Code Completion Reflection Task

Task: Use an AI tool to generate a complete program using classes, loops, and conditionals.

Prompt: "Generate a Python program for a library management system using classes, loops, and conditional statements."

```python
#Generate a Python program for a library management system using classes, loops, and conditional statements
class Book:
    def __init__(self, title, author):
        self.title = title
        self.author = author
        self.is_available = True

    def __str__(self):
        status = "Available" if self.is_available else "Checked Out"
        return f"{self.title} by {self.author} - {status}"
class Library:
    def __init__(self):
        self.books = []

    def add_book(self, book):
```

```python
class Library:
    def add_book(self, book):
        print(f'Book "{book.title}" added to the library.')

    def display_books(self):
        if not self.books:
            print("No books in the library.")
            return
        for idx, book in enumerate(self.books, start=1):
            print(f"{idx}. {book}")

    def check_out_book(self, book_index):
        if 0 <= book_index < len(self.books):
            book = self.books[book_index]
            if book.is_available:
```

```
def main():
    library = Library()
    while True:
        print("\nLibrary Management System")
        print("1. Add Book")
        print("2. Display Books")
        print("3. Check Out Book")
        print("4. Return Book")
        print("5. Exit")
        choice = input("Enter your choice (1-5): ")

        if choice == '1':
            title = input("Enter book title: ")
            author = input("Enter book author: ")
            book = Book(title, author)
```

Output:

```
Library Management System
1. Add Book
2. Display Books
3. Check Out Book
4. Return Book
5. Exit
Enter your choice (1-5): 4
No books in the library.
Enter the book index to return:
```

```
Enter the book index to return: 2
Invalid book index.
```

Code generated by AI:

```
class Book:
    def __init__(self, title, author):
        self.title = title
        self.author = author
        self.is_available = True
 def __str__(self):
        status = "Available" if self.is_available else "Checked Out"
        return f"{self.title} by {self.author} - {status}"
class Library:
    def __init__(self):
        self.books = []
 def add_book(self, book):
```

```
        self.books.append(book)
        print(f'Book "{book.title}" added to the library.')
 def display_books(self):
        if not self.books:
            print("No books in the library.")
            return
        for idx, book in enumerate(self.books, start=1):
            print(f"{idx}. {book}")
def check_out_book(self, book_index):
        if 0 <= book_index < len(self.books):
            book = self.books[book_index]

            print("Invalid choice. Please try again.")
if __name__ == "__main__":
    main()
```

Task Description #4 (AI-Assisted Code Completion for Class-Based Attendance System)

Task: Use an AI tool to generate an attendance management class.

Prompt: "Generate a Python class to mark and display student attendance using loops."

```
class Attendance:
    def __init__(self):
        self.attendance_record = {}

    def mark_attendance(self, student_name):
        self.attendance_record[student_name] = 'Present'

    def display_attendance(self):
        print("Attendance Record:")
        for student, status in self.attendance_record.items():
            print(f"{student}: {status}")
# Example usage
attendance = Attendance()
attendance.mark_attendance("Alice")
attendance.mark_attendance("Bob")
attendance.display_attendance()
```

Output:

```
PS C:\Users\harik\My project> & C:/Users/harik/AppData/Local/Programs/Python/Python313/python.exe "c:/Users/harik/My project/Assets/ASS6.5.PY"
Attendance Record:
Alice: Present
Bob: Present
```

Code generated by AI:

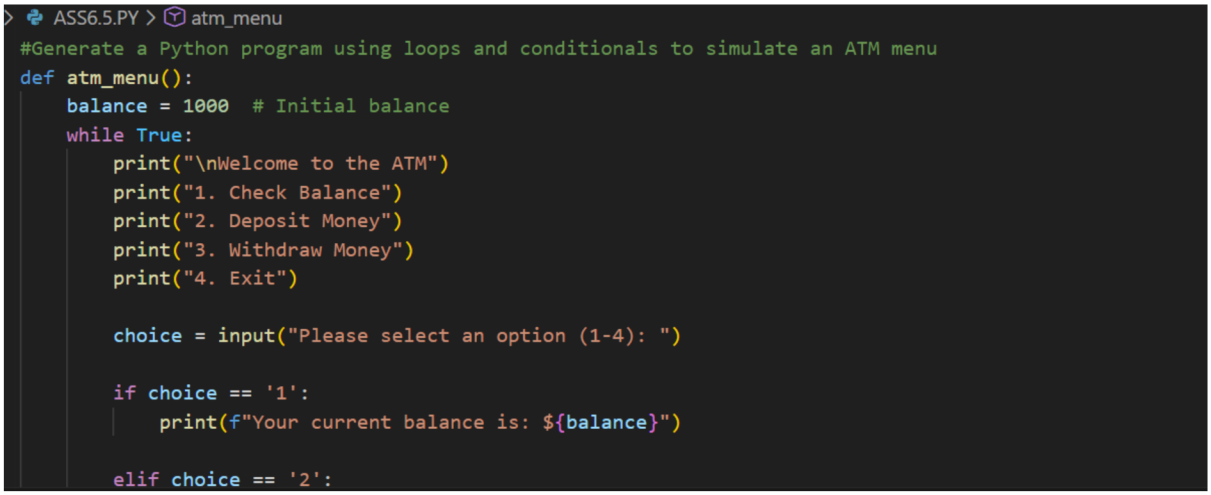
```
class Attendance:
   def __init__(self):
        self.attendance_record = {}
 def mark_attendance(self, student_name):
        self.attendance_record[student_name] = 'Present'
def display_attendance(self):
        print("Attendance Record:")
        for student, status in self.attendance_record.items():
            print(f"{student}: {status}")
# Example usage
attendance = Attendance()
attendance.mark_attendance("Alice")
attendance.mark_attendance("Bob")
attendance.display_attendance()
```

Task Description #5 (AI-Based Code Completion for Conditional

Menu Navigation)

Task: Use an AI tool to complete a navigation menu.

Prompt: "Generate a Python program using loops and conditionals to simulate an ATM menu."



```
def atm_menu():
            if 0 < withdraw <= balance:
                balance -= withdraw
                print(f"${withdraw} withdrawn successfully.")
            else:
                print("Invalid amount. Please check your balance and try again.")

        elif choice == '4':
            print("Thank you for using the ATM. Goodbye!")
            break

        else:
            print("Invalid selection. Please choose a valid option.")
# Run the ATM menu
```

Output:

```
Welcome to the ATM
1. Check Balance
2. Deposit Money
3. Withdraw Money
4. Exit
Please select an option (1-4): 3
Enter amount to withdraw: $1400
Invalid amount. Please check your balance and try again.
```

Code generated by AI:

```
def atm_menu():
    balance = 1000  # Initial balance
    while True:
        print("\nWelcome to the ATM")
        print("1. Check Balance")
        print("2. Deposit Money")
        print("3. Withdraw Money")
        print("4. Exit")

        choice = input("Please select an option (1-4): ")

        if choice == '1':
            print(f"Your current balance is: ${balance}")

        elif choice == '2':
            deposit = float(input("Enter amount to deposit: $"))
            if deposit > 0:
                balance += deposit
```

```
            print(f"${deposit} deposited successfully.")
        else:
            print("Invalid amount. Please enter a positive number.")

    elif choice == '3':
        withdraw = float(input("Enter amount to withdraw: $"))
        if 0 < withdraw <= balance:
            balance -= withdraw
            print(f"${withdraw} withdrawn successfully.")
        else:
            print("Invalid amount. Please check your balance and try again.")

    elif choice == '4':
        print("Thank you for using the ATM. Goodbye!")
        break

    else:
        print("Invalid selection. Please choose a valid option.")
# Run the ATM menu
atm_menu()
```
